

**ABSTRACT**

A ring for removing bottle caps from bottles and which is wearable on a finger is disclosed. The ring has a circumferential band defining an opening for receiving a finger. A lower portion of the band has an edge that engages the bottle cap. An upper portion of the band opposite the lower portion forms a finger engaging projection that extends axially beyond the cap engaging edge and distributes the forces along the finger resulting when the cap is pried from the bottle by curling the finger. The cap engaging edge is positioned on an axially projecting tab. The finger engaging projection has an outwardly facing surface useful for the display of indicia.
